Database Management Assignment File (ENCS205)

Bachelor of Technology

in

Computer Science and Engineering

Submitted by:

Divesh (2401010077)

B. Tech CSE (Core) – 4th Semester

Section: A

Submitted To:

MS. Mansi Kajal

School of Engineering & Technology
K. R. MANGALAM UNIVERSITY
Sohna, Haryana 122103, India

Jan-2026

1. **Consider following databases and draw ER diagram and convert entitiesand relationships to relation table for a given scenario:**

Aim: To analyze the requirements for a College Database, design an Entity-Relationship (ER) Diagram representing Students, Sections, Subjects, and Marks, and convert the conceptual model into a Relational Database Schema.

COLLEGE DATABASE:

STUDENT (USN, SName, Address, Phone, Gender)

SEMSEC (SSID, Sem, Sec)

CLASS (USN, SSID)

SUBJECT (Subcode, Title, Sem, Credits)

IAMARKS (USN, Subcode, SSID, Test1, Test2, Test3, FinalIA)

PROCEDURE:

1. The entities **STUDENT, SEMSEC, SUBJECT, and IAMARKS** are identified and represented using rectangles.
2. The attributes are represented using ellipses:

STUDENT: USN (Primary Key), SName, Address, Phone, Gender

- USN is underlined as it is the Primary Key.
- Phone is shown as a single-valued attribute.

SEMSEC: SSID (Primary Key), Sem, Sec

- SSID is underlined as the Primary Key.

SUBJECT: Subcode (Primary Key), Title, Sem, Credits

- Subcode is underlined as the Primary Key.

IAMARKS: USN, Subcode, SSID, Test1, Test2, Test3, FinalIA

- USN, Subcode, and SSID together form a composite key.
- Test1, Test2, Test3, and FinalIA are normal attributes.

3. Primary keys are represented by underlining the attribute names.
4. **CLASS** is drawn as a relationship (diamond shape) between **STUDENT** and **SEMSEC**.
5. The relationship between **STUDENT and SEMSEC** through CLASS is **M : 1**, meaning many students belong to one semester and section.
6. The **M : N relationship between STUDENT and SUBJECT** is resolved using the associative entity **IAMARKS**.
7. The relationship **STUDENT – IAMARKS** is **1 : M**, indicating one student can have multiple internal assessment records.
8. The relationship **SUBJECT – IAMARKS** is **1 : M**, indicating one subject can have multiple IA records for different students.

9. The relationship **SEMSEC – IAMARKS** is **1 : M**, showing that marks are maintained semester-section wise.
10. All entities, attributes, relationships, primary keys, foreign keys, and cardinalities are clearly represented in the ER diagram.

ER DIAGRAM:

2. Consider following databases and draw ER diagram and convert entities and relationships to relation table for a given scenario:

AIM: To analyze the requirements for a Company Database, design an Entity-Relationship (ER) Diagram representing Employees, Departments, Projects, and their relationships (Works On, Manages, Supervision), and map the ER diagram into a normalized Relational Database Schema.

COMPANY DATABASE:

EMPLOYEE (SSN, Name, Address, Salary, Sex, SuperSSN, DNO)

DEPARTMENT (DNo, DName, MgrSSN, MgrStartDate)

PROJECT (PNo, PName, PLocation, DNO)

DLOCATION (DNo, DLoc)

WORKS_ON (SSN, PNo, Hours)

MANAGES (SSN, DNo)

PROCEDURE:

1. The entities **EMPLOYEE, DEPARTMENT, PROJECT, and DLOCATION** are identified and represented using rectangles.
2. The attributes are represented using ellipses:

EMPLOYEE: SSN (Primary Key), Name, Address, Salary, Sex, SuperSSN, DNO

- SSN is underlined as it is the Primary Key.
- SuperSSN is a foreign key referencing EMPLOYEE (self-relationship).
- DNO is a foreign key referencing DEPARTMENT.

DEPARTMENT: DNo (Primary Key), DName, MgrSSN, MgrStartDate

- DNo is underlined as the Primary Key.
- MgrSSN is a foreign key referencing EMPLOYEE.

PROJECT: PNo (Primary Key), PName, PLocation, DNO

- PNo is underlined as the Primary Key.
- DNO is a foreign key referencing DEPARTMENT.

DLOCATION: DNo, DLoc

- DNo and DLoc together form a composite key.
- DNo is a foreign key referencing DEPARTMENT.

WORKS_ON: SSN, PNo, Hours

- SSN and PNo together form a composite key.
- Hours is a descriptive attribute of the relationship.

3. Primary keys are represented by underlining the attribute names.
4. The relationship **WORKS_ON** is drawn as a diamond between **EMPLOYEE** and **PROJECT** with **M : N cardinality**, indicating that:
    - One employee can work on many projects.

- One project can have many employees.
- Hours attribute represents the number of hours worked.

5. The relationship **MANAGES** is drawn between **EMPLOYEE** and **DEPARTMENT** with **1 : 1 cardinality**, indicating:
    - One employee manages one department.
    - Each department has one manager.
6. The relationship between **EMPLOYEE and DEPARTMENT** (via DNO) is **M : 1**, meaning:
    - Many employees work in one department.
7. The relationship between **DEPARTMENT and PROJECT** is **1 : M**, meaning:
    - One department controls many projects.
    - Each project belongs to one department.
8. The relationship between **DEPARTMENT and DLOCATION** is **1 : M**, meaning:
    - One department can have multiple locations.
9. A recursive relationship exists in EMPLOYEE through **SuperSSN**, representing that:
    - One employee can supervise many employees.
10. All entities, attributes, relationships, primary keys, foreign keys, and cardinalities are clearly represented in the ER diagram.

ER diagram:

3. Database Schema for a customer-sale scenario

Customer (Cust id: integer, cust_name: string)

Item (item_id: integer, item_name: string, price: integer)

Sale (bill_no:integer,bill_data:date,cust_id: integer, item_id: integer, qty_sold: integer)

For the above schema, perform the following—

1. Create the tables with the appropriate integrity constraints.
2. Insert around 10 records in each of the tables.
3. List all the bills for the current date with the customer names and item numbers.
4. List the total Bill details with the quantity sold, price of the item and the final amount.
5. List the details of the customer who have bought a product which has a price>200.
6. Give a count of how many products have been bought by each customer
7. Give a list of products bought by a customer having cust_id as 5.
8. List the item details which are sold as of today.
9. Create a view which lists out the bill_no, bill_date, cust_id, item_id, price, qty_sold, amount.
10. Create a view which lists the daily sales date wise for the last one week

Sol:

```
